The single independent claim relates to a process for the ultrasonic measurement of the layer thickness of nuclear fuel cladding tubes. In said process, a high-frequency probe with a planar surface area is used in a contact method. A probe of this type is known from Figures 1 and 2 of US-A-5 038 615 for paint layer thickness measurement in the automotive industry. However, the parts to be measured have rather minor curvature, and thus use of this probe for nuclear fuel cladding tubes does not appear to be appropriate since the latter have considerable curvature at a diameter of about 10 mm. A person skilled in the art in March 2001 would assume that such considerable curvature would result in far too many flaw echos. Claims 1-5 are therefore considered to satisfy the criteria according to PCT Article 33(2-4).

-In Claim 1, a "thin-walled tube" has been replaced by "nuclear" fuel cladding tube", and thus it can be assumed that such cladding tubes are thin-walled (PCT Article 34(2)(b))
